

# Mechanics - Physics

ECTS credits  
4 credits

Semester  
Fall

## In brief

➤ **Course language:** French

## Presentation

### Prerequisites

- 1st year course/ [Mechanics](#): basics of continuum mechanics
- 1st year course/ [Physics](#): statistical physics and quantum physics parts.
- 1st year course/ [Waves and Signal](#): Maxwell, wave and Helmholtz equations, paraxial propagation, signal processing.
- Basics of group theory.

### Learning objectives

- Use the 1st year programme to discover fundamental notions:
  - dynamics in mechanics;
  - in the case of optics, the formation of images and the transmission/retrieval of information using light;
  - in addition to the above, the course will also cover the following topics: - the concept of symmetry and variational calculus in relation to the Lagrange and Hamilton formalisms, for quantum physics.
  - fluctuations and critical phenomena for statistical physics.
- Know how to put a problem into equations using different tools.
- Know how to calculate theoretically or numerically the solutions of the different problems formulated.
- Know how to analyse the solutions obtained.

### Description of the programme

The programme is divided into three parts of equal volume: mechanics, optics, and physics (quantum and statistical).

*Mechanics:*

- Equation tools:

- Virtual power theorem and opening to the finite element method
- Hamilton's principle and Lagrange's equations
- Resolution and analysis:
  - Transient and stationary regimes
  - Modes
  - Stability and bifurcations

*Optics:*

- Matrix methods for rays and waves, Collins formula and phase space
- Types of optical system (imaging, afocal, Fourier transforming), aberrations and optical resolution
- Waveguides (metallic, dielectric and gradient index)
- Lasers: stimulated emission, coherence, cavities, modes, short pulses, amplification of chirps

*Quantum physics:*

- Infinitesimal symmetries, Lie algebra of generators: Lorentz group, spinorial transformations of the SU2 group seen as a representation of the group of rotations in  $R^3$
- Density matrix for qubits (Bloch vector), coherence and purity of a quantum state, links with optics
- Principle of least action

*Statistical physics:*

- Distribution theory and applications in physics
- Random fields applied to physics
- Equilibrium fluctuations and phase transitions

---

## Generic central skills and knowledge targeted in the discipline

- Know the links and similarities between different disciplines
- Know how to put a large number of complex systems into equations
- Know how to solve a system of equations analytically
- Know the basics of numerical methods for solving the systems encountered
- Know how to analyse the solutions obtained
- Be able to solve simple problems as seen in courses or similar to them
- Deepen basic concepts such as the principle of symmetry

---

## How knowledge is tested

CC1: written (42%)

CC2: written (42%)

CC3: mini-project in optics (8 %)

CC4: short tests at the beginning of each tutorial class (8 %)

---

## Bibliography

- PDF version of slides, PDF and CDF notes
- Physics:

-- D. Griffith, Introduction to Quantum Mechanics, Wiley (available in electronic and paper version at the centre de documentation)  
plus polycopie available on Moodle

-- Ph. Réfrégier, Noise theory and application to physics, Springer, 2003

-- J.M. Yeomans, Statistical Mechanics of Phase Transitions, Oxford Science Publications, 1992

---

## Teaching team

Optics: *Miguel Alonso*, Luis Arturo Aleman Castaneda, Frédéric Lemarquis, Laurent Gallais-During

Quantum physics: *Thomas Durt* et Marc Jaeger

Statistical physics: *Philippe Réfrégier*, Georges Bérardi, Muriel Roche, Julien Fade

Mechanics: *Emmanuelle Sarrouy*, Bruno Cochelin, Régis Cottreau, Thierry Désoyer, Cédric Maury

Total des heures			72h
CM	Master class		36h
TD	Directed work		18h
TP	Practical work		2h
AA			14h
AU			2h

## Useful info
